

Equity is a measure of the state of the trader's account. Calculated as follows: $\text{equity} = \text{balance} + \text{floating profit} - \text{floating loss}$. The remaining funds on the customer's account are calculated in the currency of the deposit. This takes into account the open position of the client at the time of scoring. Equity is very important to determine the status of the customer's account at the moment, taking into account their public transactions. It allows the investor to influence on the events in time in the case of heavily loss-making situation in the trader's trading account.
