

Locked positions - long and short positions of the same size that are open on one currency pair with a merchant account. Locked position - it is possibility to prevent large losses in the event of adverse market action. To get the locked position, you must have a "lock" ("lock"). This involves opening a position in the opposite direction of the same size as the open position, which is highly unprofitable. The castle is placed in order to "freeze" the floating of the financial result for the further out of it, under favorable conditions for this market, where you can go to a positive financial result of the original transaction, or at least minimize losses. This trading technique is widely used due to its simplicity and clarity of use.
